sliding roof

Sliding roof for high demands

The new Curtain Sider UL/HD tops have been especially developed for high demands. The “HD” means “Heavy Duty”, and not for nothing!

The hybrid construction reinforced with steel significantly widens the field of application of the modern Curtain Sider and shows once again why Edscha Trailer Systems is a synonym for sliding roofs.

Only the best materials are used for these new roofs. All parts combine optimally, and have proven their quality in practice. **Curtain Sider UL/HD** stands for a hybrid construction reinforced with steel, for robustness and reliability. As for all previous models, Edscha TS has issued recommendations for certain usages, but the width of possible applications was never larger than with the new HD roofs. The hybrid construction reinforced with steel was developed for high demands and widens the application range e.g. for the paper transportation and universal and high-cube transportation as well as the beverage and automotive industry with especially difficult loading conditions.

With its products, Edscha TS pursues the goal of increasing transport efficiency and performance, and thus also the carrier's earnings.

The HD kinematics guarantee an especially easy handling of the sliding roof with a low effort: The top can be opened and closed very easily.

It allows for almost any transport type and meets all usual requirements for a universal top as to weight, functions and ergonomics.

The joints are made of extremely durable plastic and always fold the tarpaulin in a correct and reliable manner, almost free from material wear. The mechanism can be comfortably operated from the ground by one person. The roof can be opened within seconds. The inside rolls avoid collisions and ensure a smooth freewheeling of the roll cart.
